Motivation examples

Dripping faucet

T=23.5°C liquid: ethanol p=50.8 bar gas: nitrogen frequency:562½ Hz Electrospraying

・ロト ・四ト ・ヨト ・ヨト

э

Inviscid, incompressible fluid \Rightarrow Potential flow. Uniform electric field \Rightarrow Electrostatic field. Moving boundaries:

- 1. The free boundary can change topology \rightarrow Level Set Method
- 2. The BC on the free boundary is a PDE \rightarrow Level Set Method

Motivation examples

Spraying regimes:

- Spindle mode
- Pulsating Taylor cone mode

- Cone-jet mode
- Multijet emission mode

Previous relevant works:

- ▶ Basaran et all, 1995

- ▶ Fontelos et all, 2008
- ▶ Grimm and Beauchamp, 2005
- Marginean et all, 2006

The model assumptions

Ambient fluid, ε $fluid, \varepsilon$ $fluid, \varepsilon$ u(x, y, z, t), Fluid velocity field $\phi(x, y, z, t)$, Velocity potential p(x, y, z, t), Pressure field U(x, y, z, t), Electric potential ρ, γ, ϵ , Fluid density, surface tension coefficient, permittivity $\kappa = \frac{1}{R_{t}} + \frac{1}{R_{t}}$, Twice mean curvature

- A perfectly conducting liquid droplet, initially of spherical shape, immersed in an unlimited gaseous dielectric (permittivity ε), exposed to an external uniform electric field E_∞
- The ambient medium is uniform and uncharged, the electric potential U is governed by the Laplace equation.
- Inviscid fluid droplet of density ρ. Potential flow for the interior fluid dynamics, the exterior fluid is dynamically at rest.

The model equations

$$\mathbf{u} = \nabla \phi \quad \text{in } \Omega_1(t)$$
$$\Delta \phi = 0 \quad \text{in } \Omega_1(t)$$
$$\frac{\partial \phi}{\partial t} + \frac{1}{2} |\nabla \phi|^2 + \frac{p}{\rho} = 0 \quad \text{in } \Omega_1(t)$$
$$\Delta U = 0 \quad \text{in } \Omega_2(t)$$

The pressure jump across $\Gamma_t(\mathbf{s})$: $p = p_a + \gamma \kappa - \frac{\epsilon}{2} |\nabla U \cdot \mathbf{n}|^2$

Boundary conditions for the fluid problem:

$$D_t \mathbf{R} = \mathbf{u} \text{ on } \Gamma_t(\mathbf{s})$$

$$\rho(\frac{\partial \phi}{\partial t} + \frac{1}{2} |\nabla \phi|^2) + \gamma \kappa - \frac{\epsilon}{2} |\nabla U \cdot \mathbf{n}|^2 = 0 \text{ on } \Gamma_t(\mathbf{s})$$

Boundary conditions for electric field problem:

$$U = U_0$$
 on $\Gamma_t(\mathbf{s})$
 $U = -E_\infty z$ at the far field.

Perfect conducting surface $\Rightarrow U = U_0$ on $\Gamma_t(\mathbf{s})$.

The value of U_0 at each time step is calculated imposing:

$$\begin{cases} \int_{\Gamma_t(\mathbf{s})} \frac{\partial U}{\partial n} d\Gamma = 0, \text{ for uncharged drops} \\ \int_{\Gamma_t(\mathbf{s})} \frac{\partial U}{\partial n} d\Gamma = q, \text{ for charged drops} \end{cases}$$

We make the change of variable: $U = \tilde{U} + E_{\infty}z$, and then $\tilde{U} = 0$ at infinity and $\tilde{U}|_{\Gamma_t(s)} = -E_{\infty}z + U_0$. For a single drop:

Let be $\begin{cases} \tilde{U}_n^z \text{ the flux from bound. cond. } \tilde{U} = -E_\infty z\\ \tilde{U}_n^1 \text{ the flux from bound. cond. } \tilde{U} = 1 \end{cases}$

$$\int_{\Gamma_{t}(\mathbf{s})} \tilde{U}_{n}^{z} d\Gamma + U_{0} \int_{\Gamma_{t}(\mathbf{s})} \tilde{U}_{n}^{1} d\Gamma = -E_{\infty} \int_{\Gamma_{t}(\mathbf{s})} n_{z} d\Gamma \Rightarrow U_{0} \text{ (uncharged)}$$
$$\int_{\Gamma_{t}(\mathbf{s})} \tilde{U}_{n}^{z} d\Gamma + U_{0} \int_{\Gamma_{t}(\mathbf{s})} \tilde{U}_{n}^{1} d\Gamma = q - E_{\infty} \int_{\Gamma_{t}(\mathbf{s})} n_{z} d\Gamma \Rightarrow U_{0} \text{ (charged)}$$

Characteristic scales :

$$\begin{cases} r_0 \quad \text{Initial droplet radious} \\ \sqrt{\frac{\rho r_0^3}{\gamma}} \quad \text{Capillary time} \\ \sqrt{\frac{2\gamma}{\epsilon r_0}} \quad \text{Electrical field} \end{cases}$$

All the equations in dimensionless form remains the same, except:

$$\frac{\partial \phi}{\partial t} + \frac{1}{2} |\nabla \phi|^2 + \kappa - |\nabla U \cdot \mathbf{n}|^2 = 0 \text{ on } \Gamma_t(\mathbf{s})$$

which can be rearranged

$$\frac{\partial \phi}{\partial t} + \mathbf{u} \cdot \nabla \phi = f$$
$$f = \frac{1}{2} (\mathbf{u} \cdot \mathbf{u}) - \kappa + |\nabla U \cdot \mathbf{n}|^2$$

And the only parameter left in the model is the non dimensional electric field strength at the far field:

 E_{∞}

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

Therefore, the model equations in 3D are:

$$\mathbf{u} = \nabla \phi \text{ in } \Omega_1(t)$$

$$\Delta \phi = 0 \text{ in } \Omega_1(t)$$

$$D_t \mathbf{R} = \mathbf{u} \text{ on } \Gamma_t(\mathbf{s})$$

$$D_t \phi = f \text{ on } \Gamma_t(\mathbf{s})$$

$$\Delta U = 0 \text{ in } \Omega_2(t)$$

$$U = U_0 \text{ on } \Gamma_t(\mathbf{s})$$

$$U = -E_{\infty} z \text{ at the far field}$$

Eulerian-Lagrangian formulation

Classical methods: Front tracking methods suffers difficulties when the free boundary changes topology.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ●

The Level Set formulation in 2D

・ロト・日本・モート モー うへで

Differentiating both equations with respect to t

$$\Psi_t + \mathbf{u} \cdot \nabla \Psi = 0 \text{ on } \Gamma_t(s).$$

$$D_t \Phi = G_t + \mathbf{u} \cdot \nabla G = f \text{ on } \Gamma_t(s).$$

being

$$f = \frac{1}{2}(\mathbf{u} \cdot \mathbf{u}) - \kappa + |\nabla U \cdot \mathbf{n}|^2$$

Define $\mathbf{u}_{\text{ext}}, f_{\text{ext}}$ on Ω_D such that $\begin{cases} \mathbf{u}_{\text{ext}} \mid_{\Gamma_t(s)} = & \mathbf{u}(\mathbf{R}(s,t),t) \\ f_{\text{ext}} \mid_{\Gamma_t(s)} = & f(\mathbf{R}(s,t),t) \end{cases}$

$$\begin{array}{c} D_t \mathbf{R} = \mathbf{u} \ \mbox{on } \Gamma_t(s) \end{array} \rightarrow \begin{array}{c} \Psi_t + \mathbf{u}_{\rm ext} \cdot \nabla \Psi = 0 \ \mbox{in } \Omega_D \end{array} \\ \hline D_t \phi = f \ \mbox{on } \Gamma_t(s) \end{array} \rightarrow \begin{array}{c} G_t + \mathbf{u}_{\rm ext} \cdot \nabla G = f_{\rm ext} \ \mbox{in } \Omega_D \end{array}$$

Remark: $\mathbf{u}_{\mathrm{ext}}$, and f_{ext} are obtained as in (Adals., Sethian, 1999)

The model equations in Eulerian formulation are:

4

$$\mathbf{u} = \nabla \phi \text{ in } \Omega_1(t) \tag{8}$$

$$\Delta \phi = 0 \text{ in } \Omega_1(t)$$
 (9)

$$\Psi_t + \mathbf{u}_{\text{ext}} \cdot \nabla \Psi = 0 \text{ in } \Omega_D \tag{10}$$

$$G_t + \mathbf{u}_{\text{ext}} \cdot \nabla G = f_{\text{ext}} \text{ in } \Omega_D$$
(11)

$$\Delta U = 0 \text{ in } \Omega_2(t) \tag{12}$$

$$U = U_0 \text{ on } \Gamma_t(s) \tag{13}$$

$$U = -E_{\infty}z$$
 at the far field (14)

The numerical approximation

► Time Discretization:

$$\mathbf{u}^n = \nabla \phi^n \text{ in } \Omega_1(t_n) \tag{15}$$

$$\Delta \phi^n(r,z) = 0 \text{ in } \Omega_1(t_n) \tag{16}$$

$$\frac{\Psi^{n+1} - \Psi^n}{\Delta t} = -\mathbf{u}_{\text{ext}}^n \cdot \nabla \Psi^n \text{ in } \Omega_D$$
(17)

$$\frac{G^{n+1}-G^n}{\Delta t} = -\mathbf{u}_{\text{ext}}^n \cdot \nabla G^n + f_{\text{ext}}^n \text{ in } \Omega_D, \qquad (18)$$

$$\Delta U^n(r,z) = 0 \text{ in } \Omega_2(t_n) \tag{19}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Space Discretization: $G_{i,j}^n \approx G(r_i, z_j, t_n)$, $\mathbf{u}_{ext}^n = (u^n, v^n)$.

A first order upwind scheme for Eq. (18) is:

$$\begin{array}{rcl} G_{i,j}^{n+1} & = & G_{i,j}^n - \Delta t(\max(u_{i,j}^n, 0)D_{i,j}^{-r} + \min(u_{i,j}^n, 0)D_{i,j}^{+r} \\ & + & \max(v_{i,j}^n, 0)D_{i,j}^{-z} + \min(v_{i,j}^n, 0)D_{i,j}^{+z}) + \Delta tf_{i,j}^n, \end{array}$$

We have to add the discretize BC for each particular case.

▶ At each *t_n*, the two Laplace eqn.:

$$\begin{cases} \Delta \phi = 0 \text{ subject to } \phi = G^n \text{ on } \Gamma_t(s) \\ \Delta U = 0 \text{ subject to } U = U_0^n \text{ on } \Gamma_t(s) \end{cases}$$

have to be solved:

- We use a Boundary Integral formulation for both problems and the linear BEM approximation.
- For the electric potential problem the BEM matrices calculated to solve the fluid problem can be reused. The computational expense is very reasonable.

Details in Garzon et all, 2011.

The oscillating sphere, $E_{\infty} = 0$

$$egin{aligned} \phi(r,z,0) &= 0 \ z(s) &= -\cos(s)\left(1+\epsilon P_m(\cos(s))
ight) \ r(s) &= \sin(s)\left(1+\epsilon P_m(\cos(s))
ight) \ 0 &\leq s \leq \pi, \ \epsilon \ll 1 \ \omega^2 &= rac{m(m-1)(m+2)}{m+1} \end{aligned}$$

• $\epsilon = 0.05, \ \Omega_D = [-2, 2] \times [-2, 2], \ m = 2.$

Discretization parameters
$$\begin{cases} \Delta r = \Delta z & \text{for } \Omega_D \\ \Delta s = \frac{S}{N_p - 1} & \text{for } \Gamma_t(s) \\ \Delta t \le \min(\frac{\Delta r}{|u|_{\max}}, 0.2\Delta s^{3/2}) & \text{CFL, capillary wave scales} \end{cases}$$

• Several numerical tests to check convergence properties:

$$\begin{cases} e_T &= |\frac{T_c - T}{V_c}| \le 1 \times 10^{-3} \\ e_V &= |\frac{V_f - V_0}{V_0}| \le 1 \times 10^{-3} \\ e_{\mathcal{E}} &= |\frac{\mathcal{E}_f - \mathcal{E}_0}{\mathcal{E}_0}| \le 7 \times 10^{-4} \end{cases}$$

First order convergence with respect to space (details in M.G. et al, 2011)

Droplet distortions in electric fields, $E_{\infty} \neq 0$

▶ Neutral droplet, q = 0

 $\tilde{E}^{c}_{\infty} = \frac{c}{\sqrt{8\pi}} (\frac{2\gamma}{\epsilon r})$ Taylor limit $E^{c}_{\infty} = 0.3241$ Shapes became unstable. Symmetrically elongated parallel to the electric field \Rightarrow symmetric jet discharge

• Charged droplet,
$$q \neq 0$$

 E_{∞}^{c} < Taylor limit Shapes became unstable Tear shaped drop \Rightarrow Alternate jet discharge

Conclusions

- 1. By using the level set-boundary integral approach we have built up a seamless modeling and numerical methodology to study the evolution of a perfectly conducting droplet in a uniform electric field for various field strengths.
- 2. The numerical results obtained agree very well with previously published results up to the Taylor cone formation for uncharged droplets.
- 3. Our numerical method is also able to capture the jetting discharge for electric field values beyond the critical value and the long filaments ejected are in very good agreement with the Lab experiments of Grimm and Beauchamp.
- 4. The numerical model is prepared to handle multiple drops situations (axysimmetric) and there is a lot of work ahead to obtain results beyond beakup events.
